

The University of New Mexico

Image Formation

Ed Angel

Professor Emeritus of Computer Science,
University of New Mexico

The University of New Mexico

Objectives

- Fundamental imaging notions
- Physical basis for image formation
 - Light
 - Color
 - Perception
- Synthetic camera model
- Other models

Image Formation

- In computer graphics, we form images which are generally two dimensional using a process analogous to how images are formed by physical imaging systems
 - Cameras
 - Microscopes
 - Telescopes
 - Human visual system

The University of New Mexico

Elements of Image Formation

- Objects
- Viewer
- Light source(s)

- Attributes that govern how light interacts with the materials in the scene
- Note the independence of the objects, the viewer, and the light source(s)

Light

- *Light* is the part of the electromagnetic spectrum that causes a reaction in our visual systems
- Generally these are wavelengths in the range of about 350-750 nm (nanometers)
- Long wavelengths appear as reds and short wavelengths as blues

Ray Tracing and Geometric Optics

One way to form an image is to follow rays of light from a point source finding which rays enter the lens of the camera. However, each ray of light may have multiple interactions with objects before being absorbed or going to infinity.

Luminance and Color Images

- Luminance Image
 - Monochromatic
 - Values are gray levels
 - Analogous to working with black and white film or television
- Color Image
 - Has perceptual attributes of hue, saturation, and lightness
 - Do we have to match every frequency in visible spectrum? No!

Three-Color Theory

- Human visual system has two types of sensors
 - Rods: monochromatic, night vision
 - Cones
 - Color sensitive
 - Three types of cones
 - Only three values (the *tristimulus* values) are sent to the brain
- Need only match these three values
 - Need only three *primary* colors

The University of New Mexico

Shadow Mask CRT

Additive and Subtractive Color

- Additive color
 - Form a color by adding amounts of three primaries
 - CRTs, projection systems, positive film
 - Primaries are Red (R), Green (G), Blue (B)
- Subtractive color
 - Form a color by filtering white light with cyan (C), Magenta (M), and Yellow (Y) filters
 - Light-material interactions
 - Printing
 - Negative film

The University of New Mexico

Pinhole Camera

Use trigonometry to find projection of point at (x, y, z)

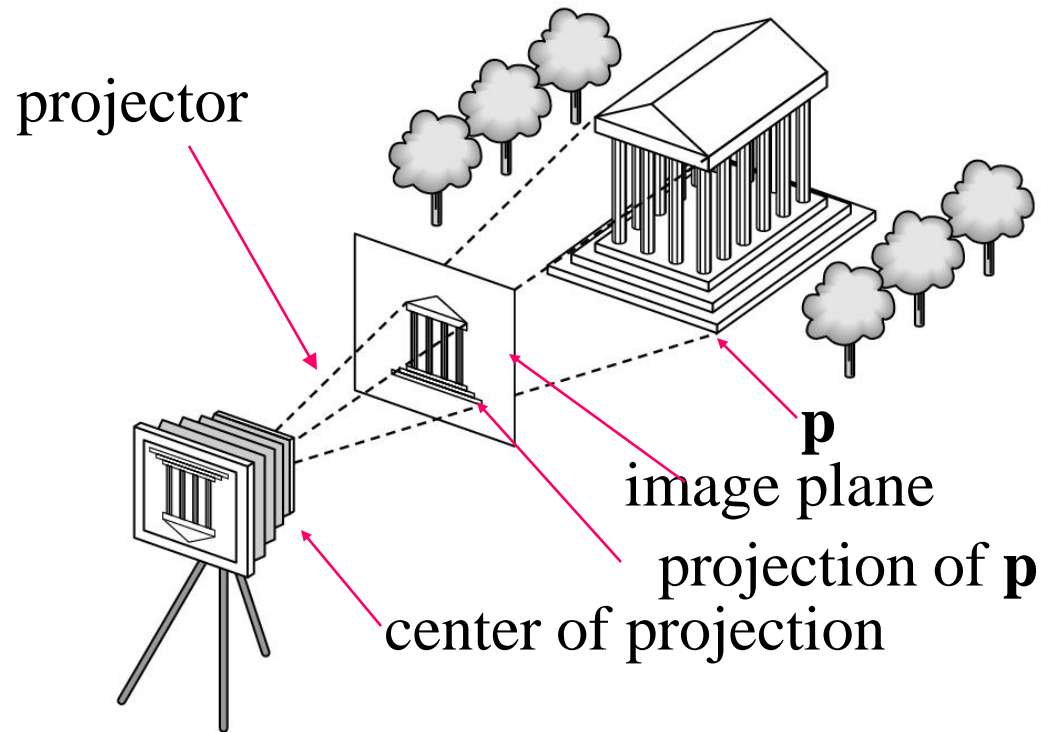

$$x_p = -x/(z/d) \quad y_p = -y/(z/d) \quad z_p = -d$$

These are equations of simple perspective

The University of New Mexico

Synthetic Camera Model

Advantages

- Separation of objects, viewer, light sources
- Two-dimensional graphics is a special case of three-dimensional graphics
- Leads to simple software API
 - Specify objects, lights, camera, attributes
 - Let implementation determine image
- Leads to fast hardware implementation

Global vs Local Lighting

The University of New Mexico

- Cannot compute color or shade of each object independently
 - Some objects are blocked from light
 - Light can reflect from object to object
 - Some objects might be translucent

Why not ray tracing?

- Ray tracing seems more physically based so why don't we use it to design a graphics system?
- Possible and is actually simple for simple objects such as polygons and quadrics with simple point sources
- In principle, can produce global lighting effects such as shadows and multiple reflections but ray tracing is slow and not well-suited for interactive applications
- Ray tracing with GPUs is close to real time
