

# **Hierarchical Modeling I**

# Ed Angel Professor Emeritus of Computer Science, University of New Mexico

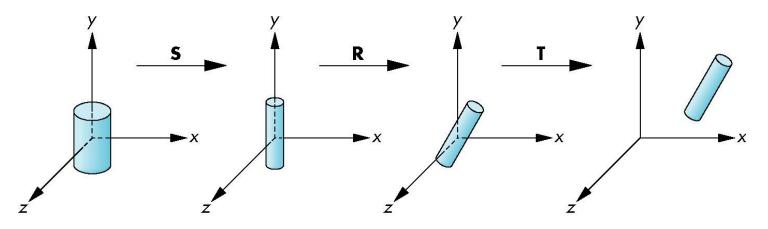

# **Objectives**

- Examine the limitations of linear modeling
  - Symbols and instances
- Introduce hierarchical models
  - Articulated models
  - Robots
- Introduce Tree and DAG models

#### **Instance Transformation**

- Start with a prototype object (a symbol)
- Each appearance of the object in the model is an *instance*
  - Must scale, orient, position
  - Defines instance transformation

# **Symbol-Instance Table**

# Can store a model by assigning a number to each symbol and storing the parameters for the instance transformation

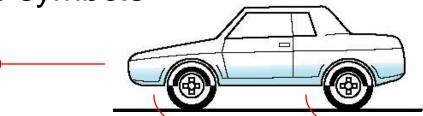

Symbol	Scale	Rotate	Translate
1	$s_{x'} s_{y'} s_{z}$	$\theta_{x'} \theta_{y'} \theta_{z}$	$d_{x}, d_{y}, d_{z}$
2	,	,	,

## Relationships in Car Model

- The University of New Mexico
  - Symbol-instance table does not show relationships between parts of model
  - Consider model of car
    - Chassis + 4 identical wheels

- Two symbols

 Rate of forward motion determined by rotational speed of wheels

# Structure Through Function Calls

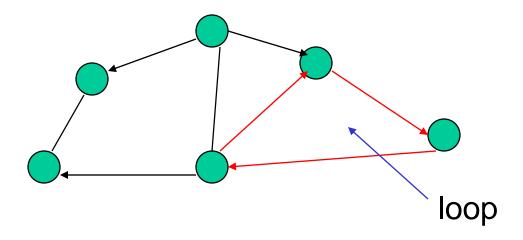

```
car(speed)
{
    chassis()
    wheel(right_front);
    wheel(left_front);
    wheel(right_rear);
    wheel(left_rear);
}
```

- Fails to show relationships well
- Look at problem using a graph

### **Graphs**

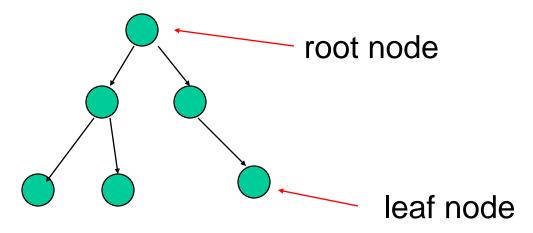

- Set of nodes and edges (links)
- Edge connects a pair of nodes
  - Directed or undirected
- Cycle: directed path that is a loop

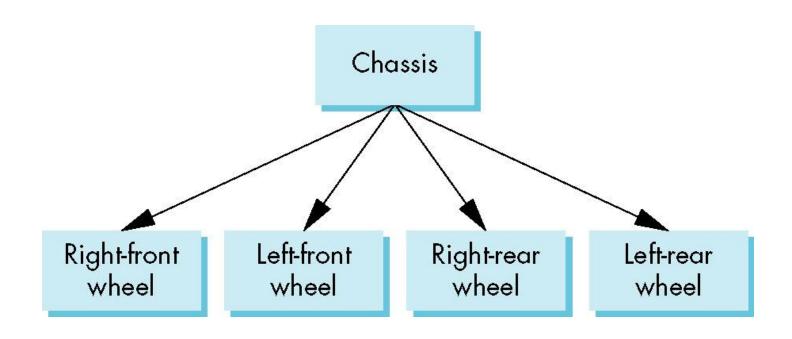

#### **Tree**

- Graph in which each node (except the root) has exactly one parent node
  - May have multiple children
  - Leaf or terminal node: no children

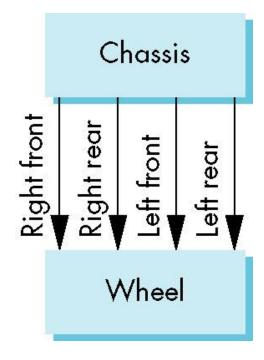

#### **Tree Model of Car**

#### **DAG Model**

- If we use the fact that all the wheels are identical, we get a directed acyclic graph
  - Not much different than dealing with a tree

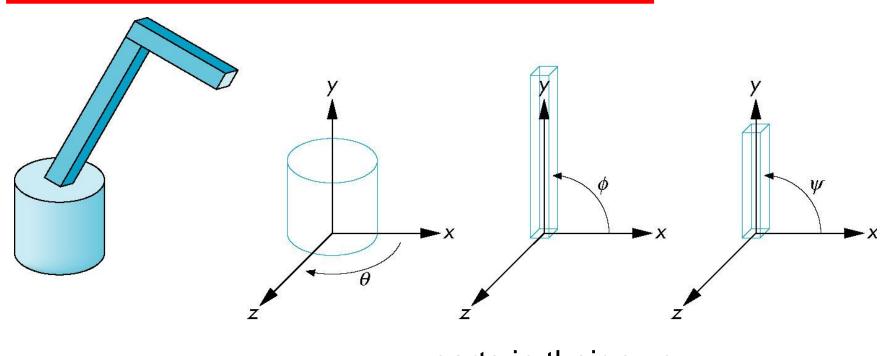

# **Modeling with Trees**

- Must decide what information to place in nodes and what to put in edges
- Nodes
  - What to draw
  - Pointers to children
- Edges
  - May have information on incremental changes to transformation matrices (can also store in nodes)

#### **Robot Arm**

robot arm

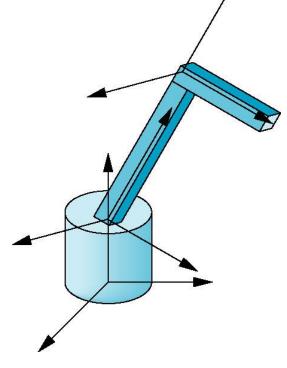

parts in their own coodinate systems

#### **Articulated Models**

Robot arm is an example of an articulated model

- Parts connected at joints
- Can specify state of model by giving all joint angles

# Relationships in Robot Arm

- Base rotates independently
  - Single angle determines position
- Lower arm attached to base
  - Its position depends on rotation of base
  - Must also translate relative to base and rotate about connecting joint
- Upper arm attached to lower arm
  - Its position depends on both base and lower arm
  - Must translate relative to lower arm and rotate about joint connecting to lower arm

## **Required Matrices**

- Rotation of base: R<sub>b</sub>
  - Apply  $\mathbf{M} = \mathbf{R}_{b}$  to base
- Translate lower arm <u>relative</u> to base:  $T_{lu}$
- Rotate lower arm around joint:  $\mathbf{R}_{lu}$ 
  - Apply  $\mathbf{M} = \mathbf{R}_{b} \mathbf{T}_{lu} \mathbf{R}_{lu}$  to lower arm
- ullet Translate upper arm  $\underline{relative}$  to upper arm:  $\mathbf{T}_{uu}$
- ullet Rotate upper arm around joint:  $old R_{uu}$ 
  - Apply  $\mathbf{M} = \mathbf{R}_b \, \mathbf{T}_{lu} \, \mathbf{R}_{lu} \, \mathbf{T}_{uu} \, \mathbf{R}_{uu}$  to upper arm

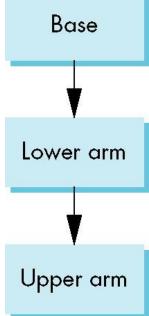

# **OpenGL Code for Robot**

```
mat4 ctm;
robot arm()
    ctm = RotateY(theta);
    base();
    ctm *= Translate(0.0, h1, 0.0);
    ctm *= RotateZ(phi);
    lower arm();
    ctm *= Translate(0.0, h2, 0.0);
    ctm *= RotateZ(psi);
    upper arm();
```

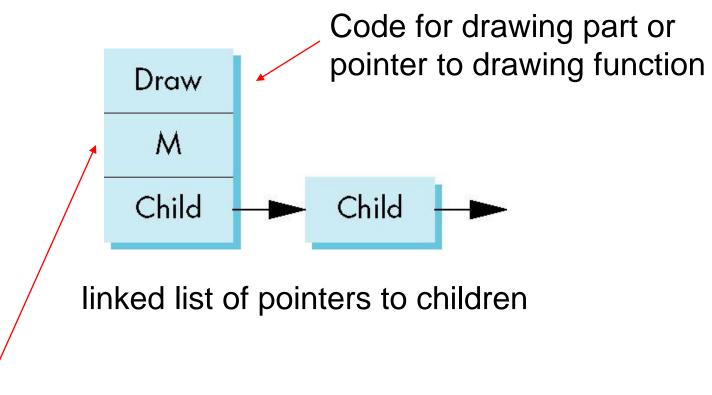

#### **Tree Model of Robot**

- Note code shows relationships between parts of model
  - Can change "look" of parts easily without altering relationships
- Simple example of tree model
- Want a general node structure for nodes

#### Possible Node Structure

matrix relating node to parent

#### Generalizations

- Need to deal with multiple children
  - How do we represent a more general tree?
  - How do we traverse such a data structure?
- Animation
  - How to use dynamically?
  - Can we create and delete nodes during execution?
